INTRODUCTION

The NVT Harvest Report – Southern Queensland provides information to support growers and advisers with decisions on variety selection for **Southern Queensland**. The information has been generated from the Grains Research and Development Corporation's (GRDC) National Variety Trials (NVT) database. This publication provides a summary of the 2024 and long-term yield performance of varieties of crop species suitable for production in **Southern Queensland** together with their quality and disease responses.

The NVT program provides growers and advisers with comparative results on yield performance, quality and disease resistance ratings of commercially available grain varieties that is independent, consistent, timely and robust.

Conducted to a set of predetermined protocols, trials are sown and managed to reflect local best practice such as sowing time, fertiliser application, weed management, pest/disease control and fungicide application. The NVT is not designed to grow varieties to their maximum yield potential.

GRDC recognises that sustaining a project of this nature hinges on the collaboration of growers who willingly provide sites and often lend a hand in trial management on their properties. Equally significant is the partnership with seed companies who supply seed of commercial varieties and experimental lines to the program.

Interpreting long-term yield results

A factor analytic (FA) mixed model approach is used in the multi-environment trial (MET) analysis conducted by GRDC, supported by the Analytics for the Australian Grains Industry (AAGI).

This approach generates long-term MET values for varieties at an individual trial level.

This format provides more detailed results to better understand a variety's performance over several years at the individual trial/environment level, rather than just a single averaged value.

In the *NVT Harvest Report – Southern Queensland*, results are presented in year groupings for yield for the past five years and quality for the past two years. Further detailed interrogation of the NVT Online results using the Long Term Yield Reporter will provide more specific performance results on all varieties of each crop species in each NVT location throughout **Southern Queensland**.

The results presented in this Harvest Report are based on the default filters in the Long Term Yield Reporter. In some cases, trial results are excluded because they do not meet the default standards for statistical validity. These are listed in the tables as 'Trial results below standard'. Trials below standard can be viewed by reducing the default VAF settings within the Long Term Yield Reporter.

Trials listed as compromised are not suitable for making variety decisions. Results can be found in the Quarantined trial reports.

Refer to the latest *Crop Sowing Guide* for further information at **nvt.grdc.com.au/resources/crop-sowing-guides**

NVT 20th anniversary

In 2025, the National Variety Trials (NVT) proudly celebrates 20 years of empowering Australian grain growers and their advisers with trusted, independent results to support varietal decision-making.

Established in 2005 by the Grains Research and Development Corporation (GRDC), the NVT program has evolved into the largest coordinated variety trial network in the world. Each year, more than 640 trials are conducted across over 300 locations nationwide, encompassing 10 different crop species. Over the past two decades, NVT has been a transformative force, providing growers with credible insights into newly released varieties that drives the rapid adoption of superior genetics.

The success of NVT is a testament to the collaborative efforts of many. GRDC extends heartfelt thanks to the growers, GRDC staff and panellists, service providers, trial hosts, breeding companies and members of the NVT Advisory Committee who have been instrumental in this journey. Your dedication has delivered exceptional outcomes, advancing the productivity and profitability of Australian grain growers and strengthening the grains industry as a whole.

As we mark this significant milestone, GRDC celebrates the achievements of NVT and looks forward to continuing to deliver game-changing innovations for Australia's grains sector in the years to come.

NVT SITE LOCATIONS – Southern Queensland

WHEAT

New wheat varieties

The following information is for wheat varieties released in the 12 months to the date when the MET analysis was published on NVT online. Please go to nvt.grdc.com.au to find trial results for any new varieties released since the publication of this harvest report.

Variety	Breeding company	Grain classification – northern zone	End point royalty* ($)	Comments supplied by breeding company[1]
Avoca[Φ]	Australian Grain Technologies Pty Ltd	TBC	3.90	Avoca[Φ] is ideally suited to high-rainfall zones. It has a relatively compact plant canopy and good physical grain quality characteristics. **Maturity description:** slow-very slow spring
Intrigue[Φ]	Australian Grain Technologies Pty Ltd	APH	4.00	Intrigue[Φ] achieves high yields relative to other varieties in moisture-stressed situations. It has a good physical grain quality package, with low screenings and high test weights. Intrigue[Φ] maintains yield potential across planting dates. **Maturity description:** mid-slow spring
Ironbark[Φ]	Australian Grain Technologies Pty Ltd	TBC	3.90	Ironbark[Φ] is derived from Beckom[Φ] and is an excellent replacement for Beckom[Φ]. It is similar in plant height and canopy to Beckom[Φ] and is very widely adapted, suited to most of southern NSW. It has improved yield and grain size compared with Beckom[Φ]. It carries the major aluminium tolerance gene, which contributes to acid soil tolerance. **Maturity description:** mid spring
Jumbuck[Φ]	InterGrain Pty Ltd	AWW	3.60	Jumbuck[Φ] has a good fit in northern growing regions with its yield stability and is well suited to late April and early May plantings. It has a solid grain quality package including excellent test weight and grain size, reducing screening risks. It has a medium plant height and good lodging tolerance. Jumbuck[Φ] was developed by breeders at CIMMYT and was brought to Australia through the CIMMYT-Australia-ICARDA Germplasm Evaluation (CAIGE) program supported by GRDC. **Maturity description:** mid-slow spring
LRPB Optimus[Φ]	LongReach Plant Breeders Pty Ltd	TBC	4.25	LRBP Optimus[Φ] has a similar plant type, yield build and grain receivals package to its LRPB Lancer[Φ] parent. Consistent high trial performance across a range of sowing times in NSW and Queensland, showing optimal yield performance when sown in the first half of May. It has strong acid and sodic soil tolerance. **Maturity description:** mid spring
LRPB Tracer[Φ]	LongReach Plant Breeders Pty Ltd	APH	4.25	LRPB Tracer[Φ] is suitable for main season seeding opportunities across NSW and Queensland. It is a strong performer in sodic soil yield trials. It has a compact canopy that can aid in stubble management in zero-till farming systems. Marketed by Pacific Seeds. **Maturity description:** mid spring
RGT Healy[Φ]	RAGT	TBC	4.25	Variety description not supplied.
Wallaroo[Φ]	Trigall Australia	TBC	4.00	Variety description not supplied.

*EPR amount is ex-GST, [Φ]denotes Plant Breeder's Rights apply. [1]All data in the table was provided by breeders. Readers should raise any issues with the displayed data directly with the breeder. Consult the Grains Australia Wheat Variety Master List for final classification in your region.

Refer to the latest *Crop Sowing Guide* for further information at nvt.grdc.com.au/resources/crop-sowing-guides

Wheat variety yield performance – Southern Queensland

Yield results are presented from the top-performing varieties within each NVT location in the region for the past five seasons. Results are presented (as a percentage) for each variety relative to the mean trial yield for the location within each year. Varieties are listed in descending order of average yield over the period.

The Long Term Yield Reporter provides additional information on varieties not listed and can be viewed as a table or chart with error bars. Rainfall is provided for January to March (J–M) and April to October (A–O) and, where relevant, irrigation from April to October.

Wheat variety quality – Southern Queensland

Grain quality for individual varieties varies from site to site and from year to year. However, long-term and across-site trends highlight varieties that can consistently achieve high protein percentage, high test weight or low grain screenings under a wider range of environments.

The following figures show the grain quality trends as histograms from 2023 and 2024 NVT averaged for trials in the Southern Queensland region. Only the varieties evaluated at every site are included. These are plotted in order of performance, up to a maximum of 20.

Protein and yield comparisons

Figure 1: Protein (%) and yield (t/ha) comparisons for main season wheat varieties from nine NVT sites in Southern Queensland in 2023.

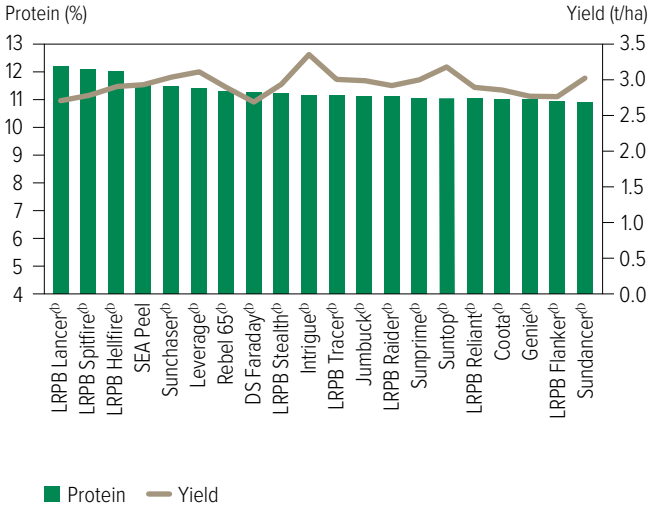

Figure 2: Protein (%) and yield (t/ha) comparisons for main season wheat varieties from nine NVT sites in Southern Queensland in 2024.

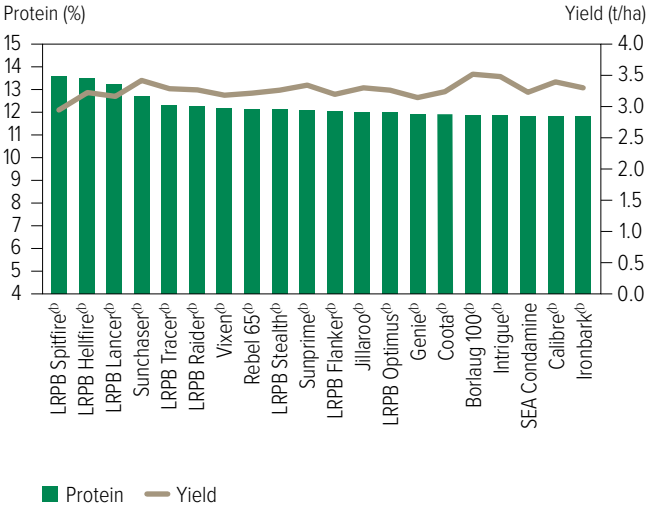

Figure 3: Protein (%) and yield (t/ha) comparisons for early season wheat varieties from eight NVT sites in Southern Queensland in 2023.

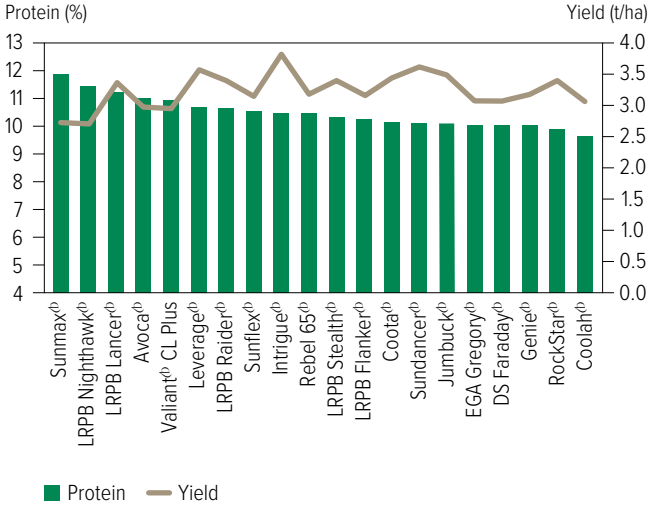

Figure 4: Protein (%) and yield (t/ha) comparisons for early season wheat varieties from eight NVT sites in Southern Queensland in 2024.

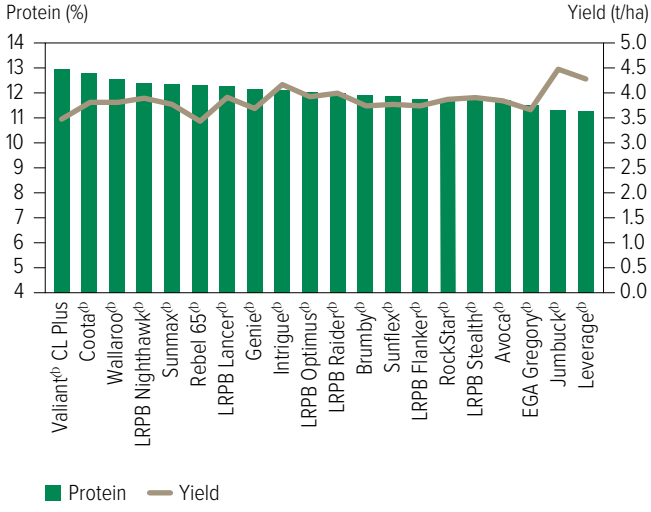

Figure 5: Protein (%) and yield (t/ha) comparisons for durum wheat varieties from two NVT sites in Southern Queensland in 2023.

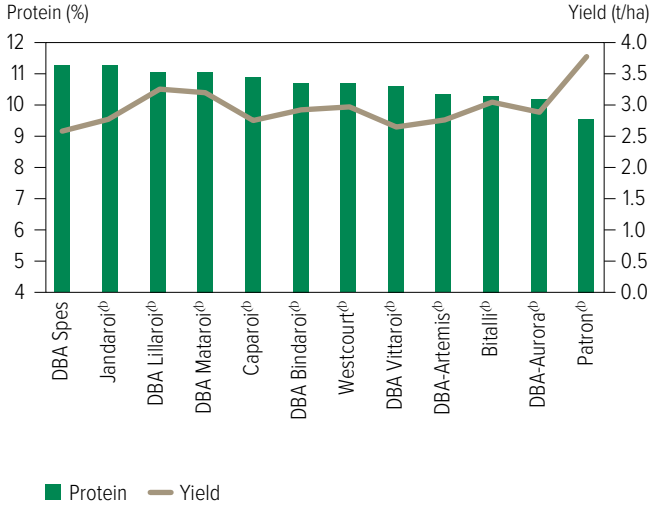

Figure 6: Protein (%) and yield (t/ha) comparisons for durum wheat varieties from one NVT site in Southern Queensland in 2024.

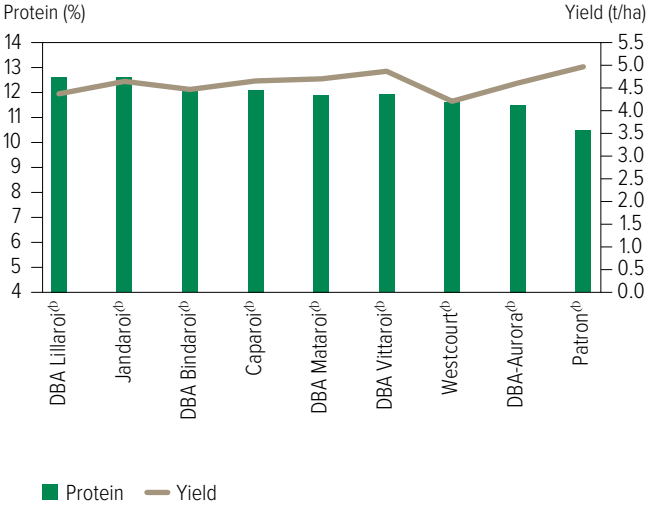

Test weight comparisons

Figure 7: Test weight (kg/hL) comparisons for main season wheat varieties from nine NVT sites in Southern Queensland in 2023.

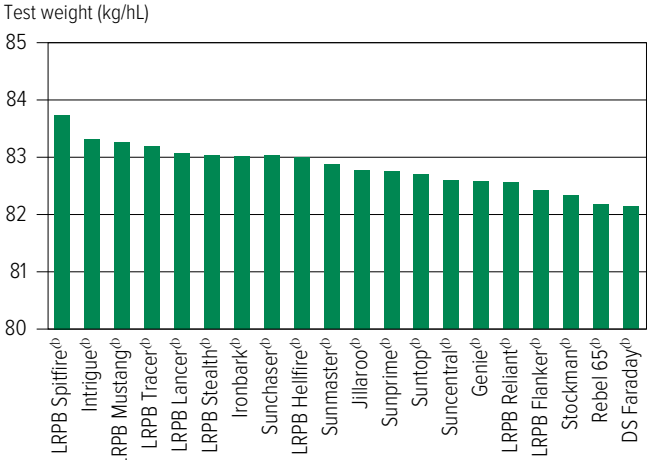

Figure 8: Test weight (kg/hL) comparisons for main season wheat varieties from nine NVT sites in Southern Queensland in 2024.

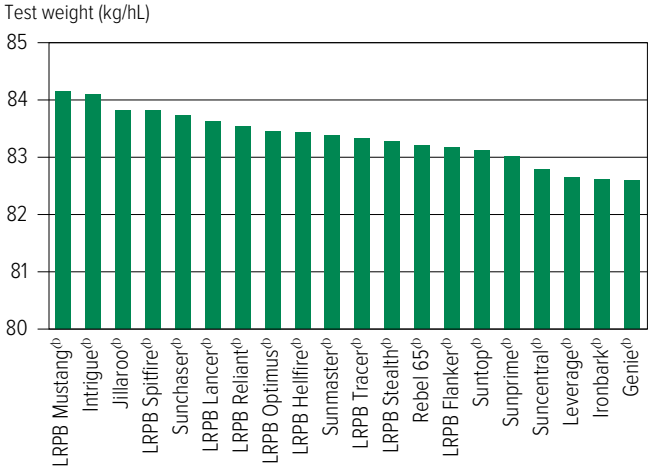

Figure 9: Test weight (kg/hL) comparisons for early season wheat varieties from eight NVT sites in Southern Queensland in 2023.

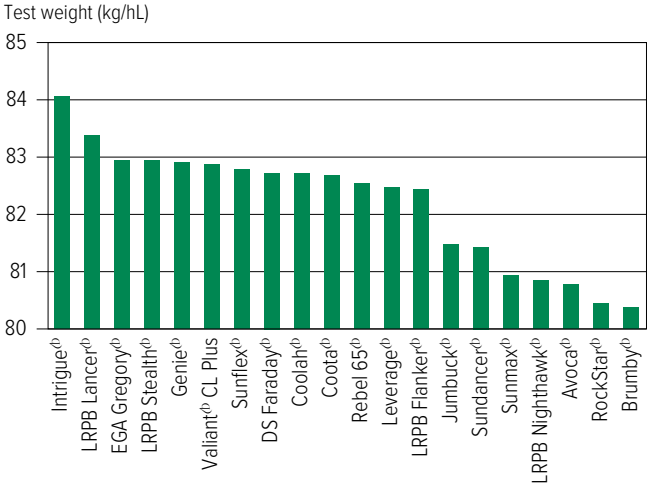

Figure 10: Test weight (kg/hL) comparisons for early season wheat varieties from eight NVT sites in Southern Queensland in 2024.

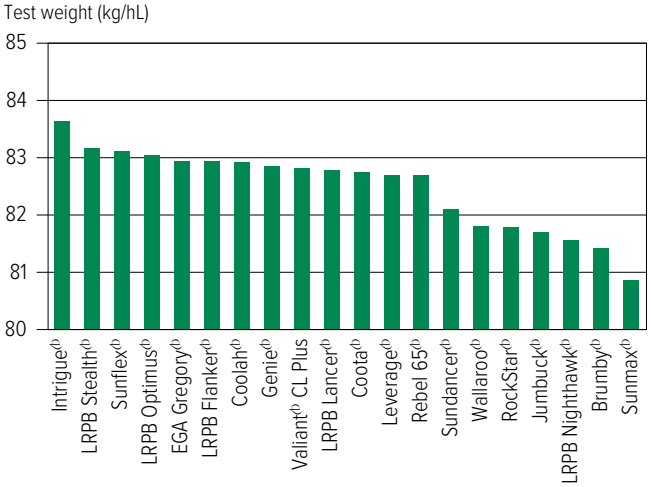

Figure 11: Test weight (kg/hL) comparisons for durum wheat varieties from two NVT sites in Southern Queensland in 2023.

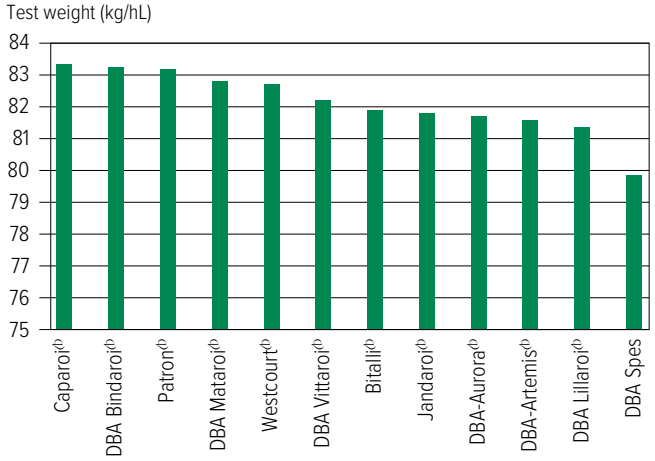

Figure 12: Test weight (kg/hL) comparisons for durum wheat varieties from one NVT site in Southern Queensland in 2024.

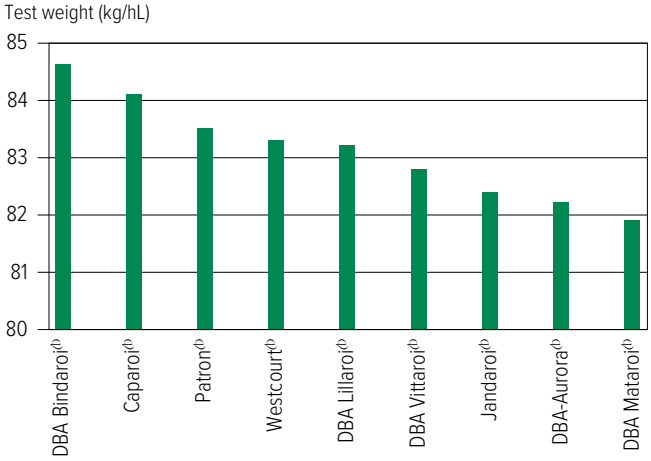

Screenings comparisons

Figure 13: Screenings (<2.0mm) comparisons for main season wheat varieties from nine NVT sites in Southern Queensland in 2023.

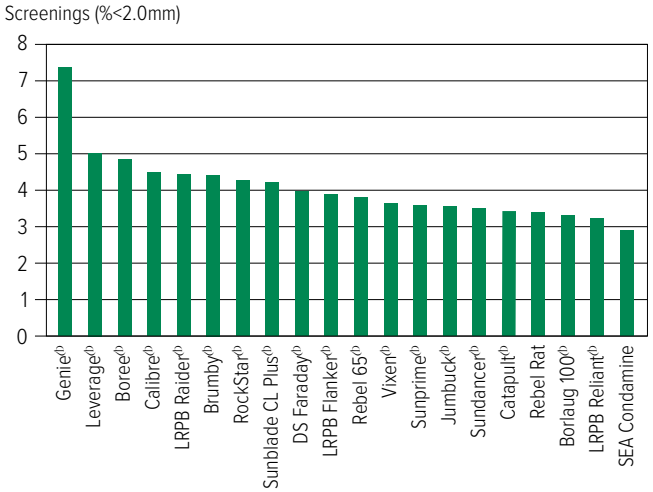

Figure 14: Screenings (<2.0mm) comparisons for main season wheat varieties from nine NVT sites in Southern Queensland in 2024.

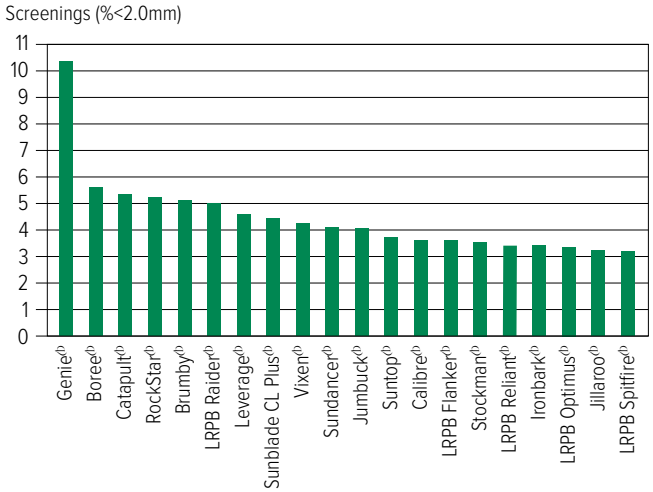

Figure 15: Screenings (<2.0mm) comparisons for early season wheat varieties from eight NVT sites in Southern Queensland in 2023.

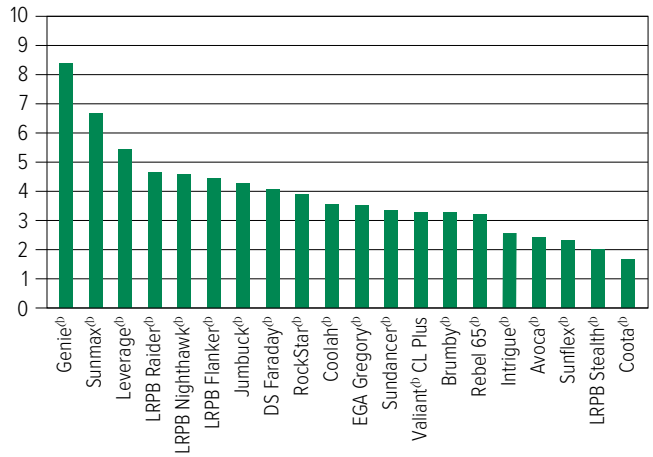

Figure 16: Screenings (<2.0mm) comparisons for early season wheat varieties from eight NVT sites in Southern Queensland in 2024.

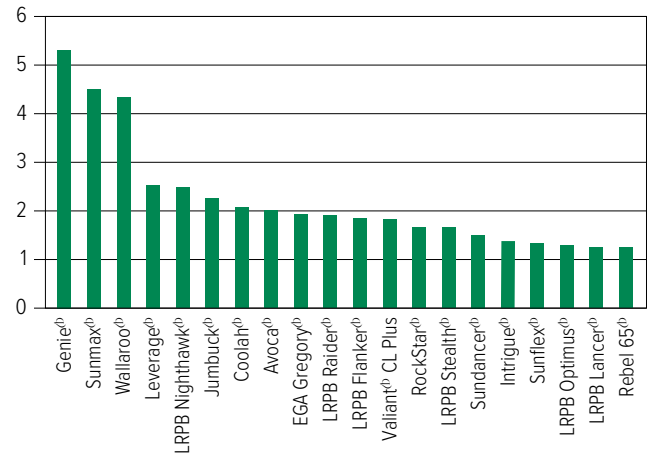

Figure 17: Screenings (<2.0mm) comparisons for durum wheat varieties from two NVT sites in Southern Queensland in 2023.

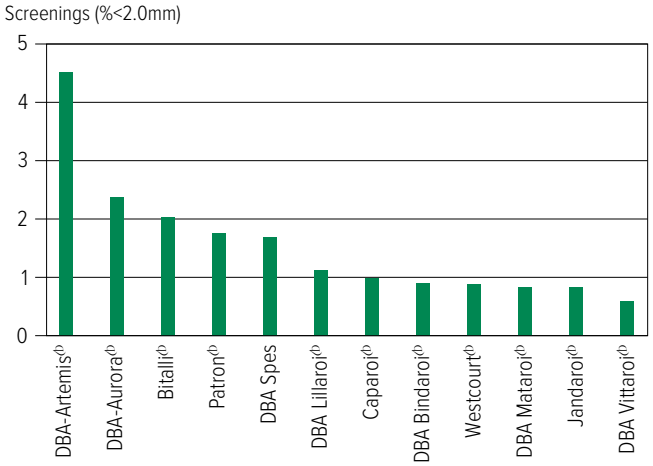

Figure 18: Screenings (<2.0mm) comparisons for durum wheat varieties from one NVT site in Southern Queensland in 2024.

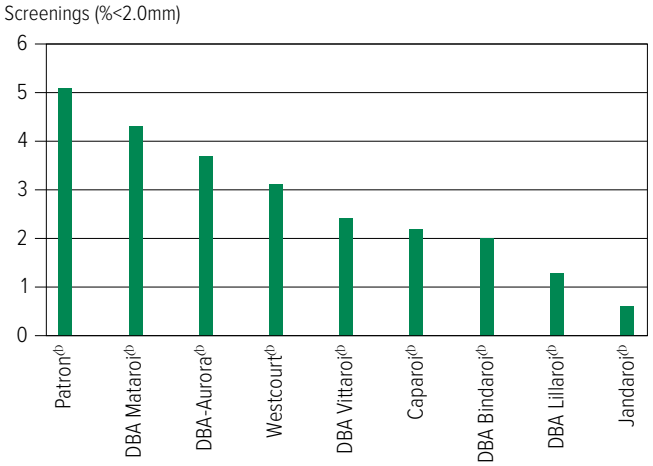

Wheat variety disease ratings – Queensland

The following tables contain varietal ratings for the predominant diseases of wheat in Queensland. These ratings are updated annually by crop pathologists and were released in March 2025.

Selected varieties of most relevance to Queensland growers are listed in alphabetical order and disease ratings are colour-coded to match resistance and tolerance ratings.

Table 25: Wheat disease guide for Queensland.

Variety	Leaf rust	Stem rust	Stripe rust (east coast resistance)	Black point	Crown rot	Powdery mildew	RLN resistance (*Pratylenchus neglectus*)	RLN tolerance (*Pratylenchus neglectus*)	RLN resistance (*Pratylenchus thornei*)	RLN tolerance (*Pratylenchus thornei*)	Yellow leaf spot

Wheat optimum time of sowing – an example for Southern Queensland

To achieve flowering in the ideal window and maximise yield, the optimum time of sowing is based on a combination of variety maturity and environment.

Growers and advisers are encouraged to use the Crop Flowering Calculator to compare the impact of specific variety selection and sowing date for the ideal flowering window at their own location. The Crop Flowering Calculator is a simple phenology (maturity) model that uses 60 years of local weather data to calculate a range of possible flowering dates for a specific environment for wheat, barley and canola.

The Crop Flowering Calculator helps optimise sowing programs by finding the variety or sowing time that best matches the optimal flowering window for a specific location. Select a location and crop type and then either 'Find a Variety' (to match a fixed sowing date), or find 'When to Sow' (to match a fixed variety).

This time of sowing guide (Figure 19) is automatically generated from the database that underpins the Crop Flowering Calculator. The guide presents the optimal sowing windows for generic varieties for a single location.

The Crop Flowering Calculator integrates the scientific outputs from several GRDC projects and Initiatives (CSP00187, CSP1901-002RTX, UOM1806-001RTX and CSP2206-012RTX) and brings together the diverse aspects of crop phenology (genetics, physiology and agronomy). This tool has been supported by CSIRO in partnership with GRDC through CSP2206-012RTX.

Figure 19: Optimum time of sowing by variety maturity for Goondiwindi as an example for Southern Queensland.

Disclaimer: This Crop Flowering Calculator is a work in progress and is still undergoing development. The results provided have not yet been fully validated and should be interpreted with caution and used at your own discretion.

BARLEY

New barley varieties

The following information is for barley varieties released in the 12 months to the date when the MET analysis was published on NVT online. Please go to nvt.grdc.com.au to find trial results for any new varieties released since the publication of this harvest report.

Variety	Breeding company	Grain classification	End point royalty* ($)	Comments supplied by breeding company[1]
Bigfoot CL(Φ)	Australian Grain Technologies Pty Ltd	FEED	4.35	Bigfoot CL(Φ) is very similar to popular northern variety Yeti(Φ) but tolerant to Clearfield® Intervix® herbicide. It has good grain size and test weight, having a short stature and lower risk of lodging. It is feed quality only. Bigfoot CL(Φ) has a quick-mid spring maturity.
PegasusAX(Φ)	Australian Grain Technologies Pty Ltd	FEED	4.15	PegasusAX(Φ) carries CoAXium herbicide tolerance (Aggressor® AX herbicide) and is a derivative of Rosalind(Φ), with a similar plant type. It has similar grain size as some other high-yielding feed varieties and is feed quality only. PegasusAX(Φ) has a quick-mid spring maturity.
Spinnaker(Φ)	Secobra Recherches	Under malt evaluation	4.00	Spinnaker(Φ) has (Fathom(Φ) x RGT Planet(Φ)) x European malt breeding line heritage. It is two to three days earlier maturing than RGT Planet(Φ) with a May planting and has slightly shorter plant height than RGT Planet(Φ).

*EPR amount is ex-GST , (Φ)denotes Plant Breeder's Rights apply. [1]All data in the table was provided by breeders. Readers should raise any issues with the displayed data directly with the breeder. Grain classification downloaded from Grains Australia on 14/3/2025.

Refer to the latest *Crop Sowing Guide* for further information at nvt.grdc.com.au/resources/crop-sowing-guides

Barley variety yield performance – Southern Queensland

Yield results are presented from the top-performing varieties within each NVT location in the region for the past five seasons. Results are presented (as a percentage) for each variety relative to the mean trial yield for the location within each year. Varieties are listed in descending order of average yield over the period.

The Long Term Yield Reporter provides additional information on varieties not listed and can be viewed as a table or chart with error bars. Rainfall is provided for January to March (J–M) and April to October (A–O) and, where relevant, irrigation from April to October.

Barley variety quality – Southern Queensland

Grain quality for individual varieties varies from site to site and from year to year. However, long-term and across-site trends highlight varieties that can consistently achieve high protein percentage, high test weight or low grain screenings under a wider range of environments.

The following figures show the grain quality trends as histograms from 2023 and 2024 NVT averaged for trials in the Southern Queensland region. Only the varieties evaluated at every site are included. These are plotted in order of performance, up to a maximum of 20.

Protein and yield comparisons

Figure 1: Protein (%) and yield (t/ha) comparisons for main season barley varieties from four NVT sites in Southern Queensland in 2023.

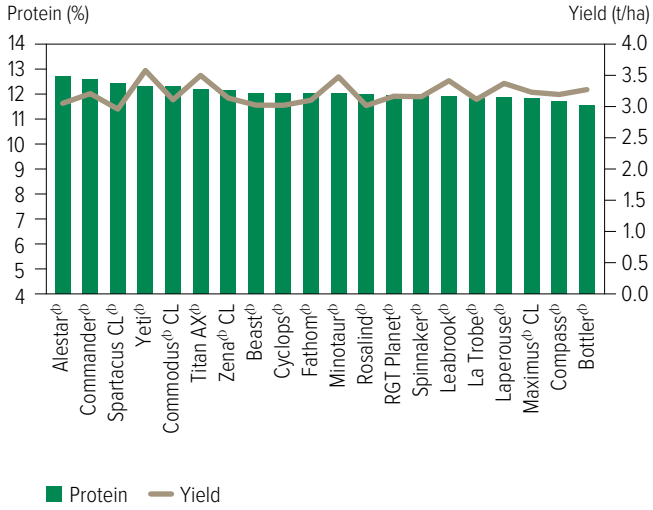

Figure 2: Protein (%) and yield (t/ha) comparisons for main season barley varieties from two NVT sites in Southern Queensland in 2024.

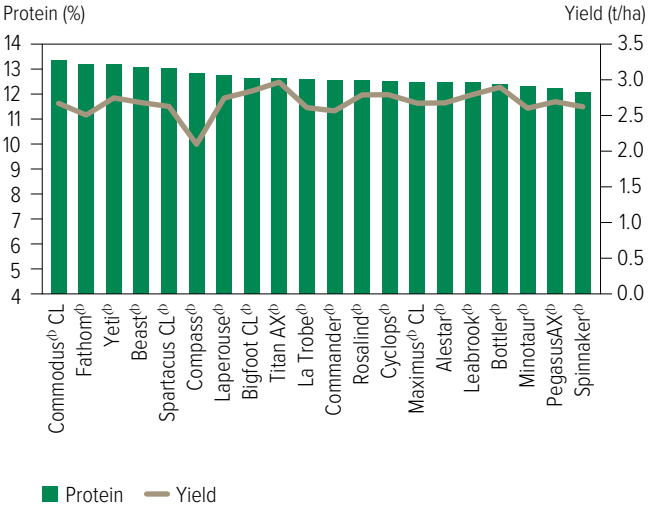

Test weight comparisons

Figure 3: Test weight (kg/hL) comparisons for main season barley varieties from four NVT sites in Southern Queensland in 2023.

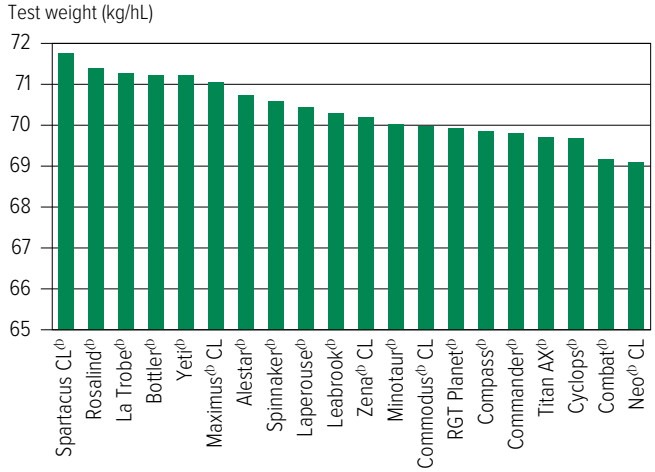

Figure 4: Test weight (kg/hL) comparisons for main season barley varieties from two NVT sites in Southern Queensland in 2024.

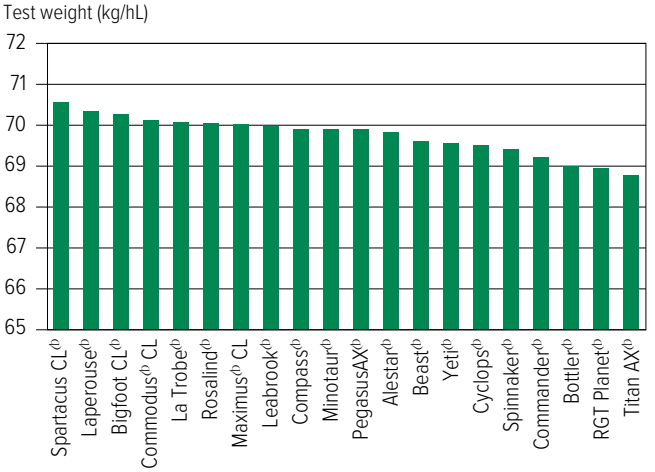

Screenings comparisons

Figure 5: Screenings (<2.2mm) comparisons for main season barley varieties from four NVT sites in Southern Queensland in 2023.

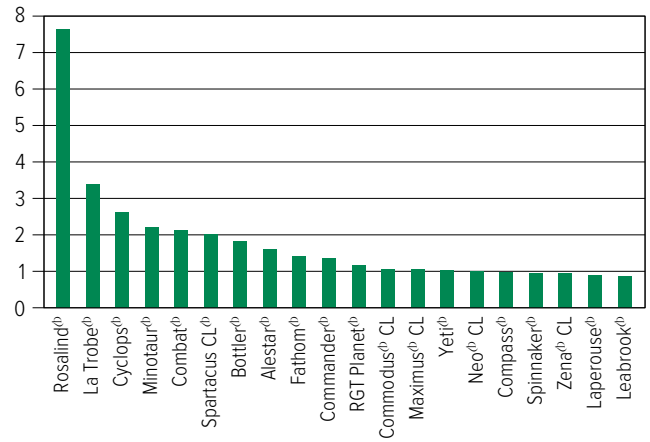

Figure 6: Screenings (<2.2mm) comparisons for main season barley varieties from two NVT sites in Southern Queensland in 2024.

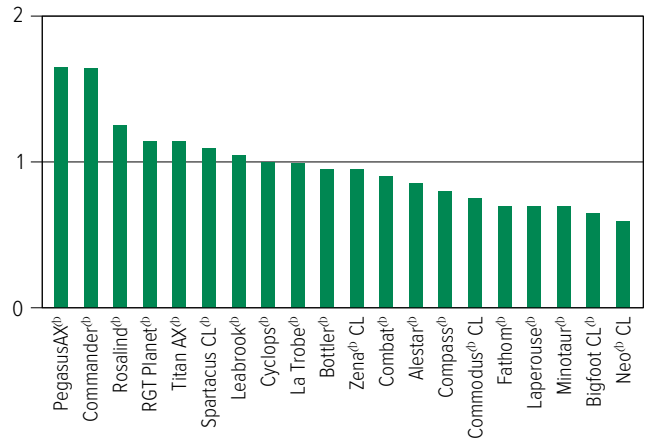

Retention comparisons

Figure 7: Retention (>2.5mm) comparisons for main season barley varieties from four NVT sites in Southern Queensland in 2023.

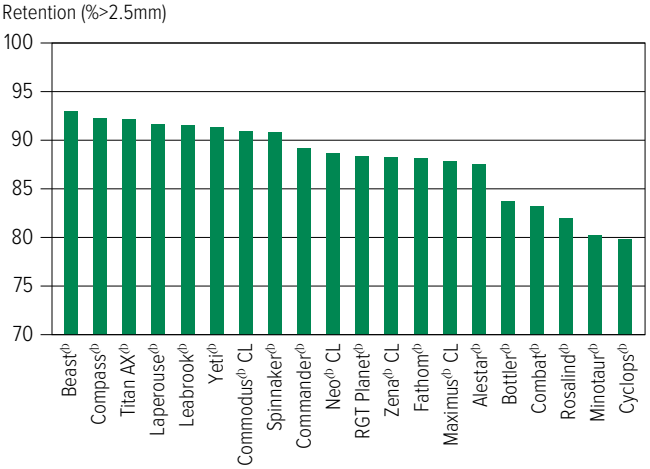

Figure 8: Retention (>2.5mm) comparisons for main season barley varieties from two NVT sites in Southern Queensland in 2024.

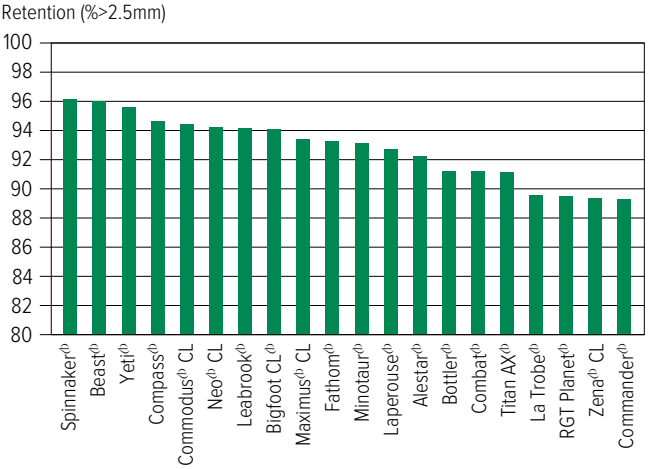

Barley variety disease ratings – Queensland

The following tables contain varietal ratings for the predominant diseases of barley in Queensland. These ratings are updated annually by crop pathologists and were released in March 2025.

Selected varieties of most relevance to Queensland growers are listed in alphabetical order and disease ratings are colour-coded to match resistance and tolerance ratings.

Table 6: Barley disease guide for Queensland.

Chickpea variety disease ratings – Queensland

The following table contains varietal ratings for the predominant diseases of chickpea in Queensland. These ratings are updated annually by crop pathologists and were released in March 2025.

Selected varieties of most relevance to Queensland growers are listed in alphabetical order and disease ratings are colour-coded to match resistance and tolerance ratings.

Table 5: Chickpea disease guide for Queensland.

Variety	Ascochyta blight (pathogen group 2 – north)	2022-23 Phytophthora root rot	RLN resistance (*Pratylenchus neglectus*)	RLN tolerance (*Pratylenchus neglectus*)	RLN resistance (*Pratylenchus thornei*)	RLN tolerance (*Pratylenchus thornei*)
DESI						
CBA Captain(Ф)	MS (P)	S	MR	MT	MS	MT
Genesis® 836	S		MR	MII	MS	MT
Kyabra(Ф)	VS	VS	MRMS	MT	S	MT
Neelam(Ф)	S		MRMS	MI	MS	MTMI
PBA Boundary(Ф)	S	VS	RMR	MTMI	MRMS	MT

KABULI						
Almaz(Ф)	MS		MRMS	MI	S	I
Genesis® 090	MS		MRMS	IVI	MS	MII
Genesis® Kalkee	S		MRMS	VI	MS	MI
PBA Magnus(Ф)	MS		MRMS	MI	MSS	IVI
PBA Monarch(Ф)	MS (P)		MRMS	IVI	MS	I
PBA Royal(Ф)	MS		MR (P)	MII	MS	MI

Learn more via the NVT Disease Ratings.
R = resistant, MR = moderately resistant, MS = moderately susceptible, S = susceptible, VS = very susceptible, T = tolerant, MT = moderately tolerant, MI = moderately intolerant, I = intolerant, VI = very intolerant, (P) = provisional rating, - hyphen indicates a range, / indicates pathotype differences, # warning, may be more susceptible to alternate pathotypes, ^ line contains a few susceptible off types, ( ) show outlier.

FABA BEAN

Faba bean variety yield performance – Southern Queensland

Yield results are presented from the top-performing varieties within each NVT location in the region for the past five seasons. Results are presented (as a percentage) for each variety relative to the mean trial yield for the location within each year. Varieties are listed in descending order of average yield over the period.

The Long Term Yield Reporter provides additional information on varieties not listed and can be viewed as a table or chart with error bars. Rainfall is provided for January to March (J–M) and April to October (A–O) and, where relevant, irrigation from April to October.

Table 1: Billa Billa faba bean.

Year	2020	2021	2022	2023	2024
Mean yield (t/ha)		2.26			2.60
PBA Warda[Φ]	Compromised trial	98	Trial failed	Compromised trial	105
PBA Nasma[Φ]		99			101
FBA Ayla[Φ]		96			96
PBA Nanu[Φ]		91			99
Cairo		89			89
Doza		84			85
Sowing date	**17 Apr**	**27 Apr**	**27 Apr**	**25 Apr**	**20 Apr**
